

## 8.15 Schur-Weyl duality and irreps of $GL(d, K)$

Refs.: ① § 11.16 of Moore

② Fulton & Harris, Chap 6.

In a general physical system, the full representation space is given by tensor product of single-particle Hilbert spaces  $\mathcal{H}_n = \bigotimes^n \mathcal{H}_1$ . So naturally we want to understand how it decomposes into smaller irreps. Now we try to understand the structure of  $V^{\otimes n}$ , where  $V$  is a general rep. ( $V = K^d$ ,  $K = \mathbb{R}, \mathbb{C}$ )

We start simple, with  $V \otimes V$ . It forms a natural rep of  $S_2$ :

$$\sigma = (12): \quad v_i \otimes v_j \mapsto v_j \otimes v_i$$

Define Young symmetrizers  $C_+ = e + (12) \quad \boxed{112}$   
 $C_- = e - (12) \quad \boxed{12}$

$$C_+ V^{\otimes 2} = \text{Span} \{ v_i \otimes v_j + v_j \otimes v_i \} =: \text{Sym}^2 V$$

$$C_- V^{\otimes 2} = \text{Span} \{ v_i \otimes v_j - v_j \otimes v_i \} =: \Lambda^2 V$$

$$V^{\otimes 2} \cong \text{Sym}^2 V \oplus \Lambda^2 V \cong D^+ \otimes \mathbb{1}^+ \oplus D^- \otimes \mathbb{1}^- \text{ isotropic decomposition}$$
$$\dim = \frac{d(d+1)}{2} \quad \frac{d(d-1)}{2}$$

Any element  $t \in V^{\otimes 2}$  is given by a rank-2 tensor:

$$t = \sum_{ij} a_{ij} v_i \otimes v_j \quad (a \in \mathbb{K}^{d^2})$$

$S_2$  can be seen as equally acts on the tensor  $a$ :

$$\begin{aligned} \sigma \cdot t &= \sum_{ij} a_{ij} v_j \otimes v_i = \sum_{ij} a_{ji} v_i \otimes v_j \\ \text{i.e. } (\sigma \cdot a)_{ij} &= a_{ji} \end{aligned}$$

Now consider  $V$  the rep of  $G$ , some internal sym, then  $V \otimes V$  is naturally a rep of  $G$ .

$$T_{(g)}^{V \otimes V} (v_i \otimes v_j) = T(g)v_i \otimes T(g)v_j$$

$$\begin{aligned} \text{on tensor, } T(g) \cdot t &= \sum_{ij} a_{ij} (T(g)v_i \otimes T(g)v_j) \\ &= \sum_{ij} a_{ij} \underbrace{M_{ki} M_{lj}}_{k,l} v_k \otimes v_l \\ \text{i.e. } (g \cdot a)_{kl} &= \sum_{ij} \underbrace{M(g)_{ki}}_k \underbrace{M(g)_{lj}}_l a_{ij} \end{aligned}$$

(contracts the column index)

Now a very useful observation:

the action of  $G$  and  $S_n$  commutes on  $V^{\otimes n}$

$$\left\{ \begin{array}{l} g \cdot \sigma v_i \otimes v_j = g \cdot v_j \otimes v_i = \sum_{kl} M_{kj} M_{li} v_k \otimes v_l \\ \sigma \cdot g v_i \otimes v_j = \sigma \sum_{kl} M_{ki} M_{lj} v_l \otimes v_k = \sum_{kl} M_{kj} M_{li} v_k \otimes v_l \end{array} \right.$$

$V^{\otimes n}$  is a rep of  $G \times S_n$

What's the significance?

We can perform isotypic decomposition of  $V^{\otimes n}$  as

$$V^{\otimes n} \cong \bigoplus_{\lambda} D^{\lambda} \otimes R_{\lambda}.$$

$\lambda$  a partition of  $n$ . i.e. labels an irrep. of  $S_n$

$D^{\lambda} = \text{Hom}_{S_n}(R_{\lambda}, V^{\otimes n})$  is the degeneracy space/multiplicity space spanned by all linear maps from  $R_{\lambda}$  into  $V^{\otimes n}$  that commute with  $S_n$  action

$$(T \in D^{\lambda}, \quad T(\sigma \cdot r) = \sigma \cdot T(r))$$

Schur - Weyl duality theorem : (Fulton & Harris for proofs)

$$V^{\otimes n} \cong \bigoplus_{\lambda} D_{\lambda} \otimes R_{\lambda}$$

$R_{\lambda}$  are the irreps of  $S_n$

$D_{\lambda} = \text{Hom}_{S_n}(R_{\lambda}, V^{\otimes n})$  the degeneracy space.

The representations  $D_{\lambda}$  are irreducible representations of  $GL(d, K)$  (and its subgroups)

All irreps can be found by varying  $n$

Thus. to construct  $D_{\lambda}$ , as we have seen earlier.

can be done by decomposition into irreps of  $S_n$ , which

can be done using Young symmetrizers.

$$V^{\otimes n} \cong \bigoplus_T P(T) V^{\otimes n}$$

$\{T\}$  are standard tableaux

Example. Spin-0 and 1 rep of  $SU(2)$

Consider  $G = SU(2)$  and  $S_2$

$$V = \{ |+\rangle, |-\rangle \}$$

$$V^{\otimes 2} = \{ |s_1 s_2\rangle \otimes |s_1 s_2\rangle, s_i \in V \} \quad \dim = 4$$

$$V^{\otimes 2} \cong W_1 \otimes P^+ \oplus W_0 \otimes P^-$$

$$W_1 = \text{Sym}^2 V = \{ |+\rangle \otimes |+\rangle, \frac{1}{\sqrt{2}} (|+\rangle \otimes |-\rangle + |-\rangle \otimes |+\rangle), |-\rangle \otimes |-\rangle \}$$

$$W_0 = \wedge^2 V = \{ \frac{1}{\sqrt{2}} (|+\rangle \otimes |-\rangle - |-\rangle \otimes |+\rangle) \}$$

Now consider the group action of  $g \in SU(2)$  on  $V$ .

$$g = \begin{pmatrix} \alpha & -\bar{\beta} \\ \beta & \bar{\alpha} \end{pmatrix} \quad |+\rangle = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad |-\rangle = \begin{pmatrix} 0 \\ 1 \end{pmatrix}$$

$$\begin{cases} g|+\rangle = \alpha|+\rangle + \beta|-\rangle \\ g|-\rangle = -\bar{\beta}|+\rangle + \bar{\alpha}|-\rangle \end{cases} \quad (= g_{11}|+\rangle + g_{21}|-\rangle)$$

$$\begin{aligned} g|1,1\rangle &= g|+\rangle \otimes g|+\rangle = \alpha^2|++\rangle + \alpha\beta(|+-\rangle + |-+\rangle) \\ &\quad + \beta^2|--\rangle \end{aligned}$$

$$= \alpha^2|1,1\rangle + \sqrt{2}\alpha\beta|1,0\rangle + \beta^2|1,-1\rangle$$

$$g|1,-1\rangle = \bar{\beta}^2 |++\rangle - \bar{\alpha}\bar{\beta} (|+-\rangle + |-+\rangle) + \bar{\alpha}^2 |--\rangle$$

$$= \bar{\beta}^2 |1,1\rangle - \sqrt{2}\bar{\alpha}\bar{\beta} |1,-\rangle + \bar{\alpha}^2 |1,-\rangle$$

$$g|1,0\rangle = \frac{1}{\sqrt{2}} (g|+\rangle \otimes g|-\rangle + g|-\rangle \otimes g|+\rangle)$$

$$= \frac{1}{\sqrt{2}} ( -2\bar{\alpha}\bar{\beta} |++\rangle + (\alpha^2 - \beta^2) (|+-\rangle + |-+\rangle) + 2\bar{\alpha}\bar{\beta} |--\rangle )$$

$$= -\sqrt{2}\bar{\alpha}\bar{\beta} |1,1\rangle + (\alpha^2 - \beta^2) |1,0\rangle + \sqrt{2}\bar{\alpha}\beta |1,-1\rangle$$

$$D^1(g) = \begin{pmatrix} |1,1\rangle & |1,0\rangle & |1,-1\rangle \\ \alpha^2 & -\sqrt{2}\bar{\alpha}\bar{\beta} & \bar{\beta}^2 \\ \sqrt{2}\bar{\alpha}\bar{\beta} & (\alpha^2 - \beta^2) - \sqrt{2}\bar{\alpha}\beta & \bar{\alpha}^2 \\ \beta^2 & \sqrt{2}\bar{\alpha}\beta & \alpha^2 \end{pmatrix} \quad \text{Wigner-D matrix}$$

Letter:  $\text{Sym}^n(\mathbb{C}^2)$  are irreps of  $\text{SU}(2)$  defined by the trivial irrep of  $S_n$ .  $\dim = \binom{n+d-1}{n} \stackrel{d=2}{=} n+1$

For  $W_0 = \frac{1}{\sqrt{2}}(|+-\rangle - |-\rangle) \} \equiv |0,0\rangle \quad \text{Scalar/trivial}$

$$\begin{aligned} g|0,0\rangle &= \frac{1}{\sqrt{2}}(\alpha^2 |+-\rangle - \beta^2 |-\rangle) & g|+\rangle &= \alpha|+\rangle + \beta|-\rangle \\ &\quad - (\alpha^2 |+-\rangle - \beta^2 |-\rangle) & g|-\rangle &= -\bar{\beta}|+\rangle + \bar{\alpha}|-\rangle \\ &= \frac{1}{\sqrt{2}}(|+-\rangle - |-\rangle) = |0,0\rangle \end{aligned}$$

$\Rightarrow$  Tensors of definite symmetries (obtained via Young symmetrizers) transform as irreps of  $GL(d, \mathbb{K})$ .

Example .  $V^{\otimes 3} = \text{span} \{ v_i \otimes v_j \otimes v_k \}$

$$\begin{array}{c|c|c|c|c} S_3 & [10] & [12] & [123] & [123] \\ \hline 1^+ & 1 & 1 & 1 & 1 \\ \hline 1^- & 1 & -1 & 1 & \\ \hline 2 & 2 & 0 & -1 & \\ \hline \end{array}$$

$\chi([10]) = d^3$

$\chi([12]) = d^2$

$\chi([123]) = d$

$$\alpha_{1^+} = \langle \chi_{1^+}, \chi \rangle = \frac{1}{6} (d^3 \times 1 + d^2 \times 3 + d \times 2) = \frac{1}{6} d(d+1)(d+2)$$

$$\alpha_{1^-} = \langle \chi_{1^-}, \chi \rangle = \frac{1}{6} (d^3 - 3d^2 + 2d) = \frac{1}{6} d(d-1)(d-2)$$

$$\alpha_2 = \langle \chi_2, \chi \rangle = \frac{1}{6} (2d^3 - 2d) = \frac{1}{3} d(d+1)(d-1)$$

①  $|1|2|3|$   $C = P \otimes Q = e + (12) + (13) + (23) + (123) + (132)$

$$C \cdot V^{\otimes 3} = \text{span} \{ \sum_{\sigma} v_{\sigma(i)} \otimes v_{\sigma(j)} \otimes v_{\sigma(k)} \}$$

$$= \text{Sym}^3 V$$

$$t = \sum a_{ijk} v_i \otimes v_j \otimes v_k$$

$$G \cdot t = \sum a_{\sigma(i) \sigma(j) \sigma(k)} v_{\sigma(i)} \otimes v_{\sigma(j)} \otimes v_{\sigma(k)}$$

$$= \sum a_{\sigma^{-1}(i) \sigma^{-1}(j) \sigma^{-1}(k)} v_i \otimes v_j \otimes v_k$$

$$\Rightarrow (G \cdot a)_{ijk} = a_{\sigma^{-1}(i) \sigma^{-1}(j) \sigma^{-1}(k)}$$

$$(a_s)_{ijk} = \sum_{\sigma} a_{\sigma(i) \sigma(j) \sigma(k)} = \sum_{\sigma} a_{\sigma(i) \sigma(j) \sigma(k)}$$

$$\Rightarrow (a_s)_{jik} = (a_s)_{ijk}$$

$$(\sigma a_s)_{ijk} = (a_s)_{ijk}$$

$$\textcircled{2} \quad \begin{array}{|c|c|} \hline 1 & \\ \hline 2 & \\ \hline 3 & \\ \hline \end{array} \quad c = e - (12) - (13) - (23) + (123) + (132)$$

$$(\alpha_N)_{ijk} = \sum_{\sigma} \text{sgn}(\sigma) \alpha_{\sigma^{-1}(i), \sigma^{-1}(j), \sigma^{-1}(k)}$$

$$\begin{aligned} (\alpha_N)_{jik} &= (\tau(ij) \alpha_N)_{ijk} \\ &= \sum_{\sigma} \underbrace{\tau(ij)}_{\sigma^{-1}(i) \leftrightarrow \sigma^{-1}(j)} \underbrace{\text{sgn}(\sigma)}_{\sigma^{-1}(i), \sigma^{-1}(j), \sigma^{-1}(k)} \underbrace{\alpha_{\sigma^{-1}(i), \sigma^{-1}(j), \sigma^{-1}(k)}}_{\sigma^{-1}(i) \leftrightarrow \sigma^{-1}(j)} \\ &= \sum_{\sigma} \text{sgn}(\sigma) \underbrace{\alpha_{\sigma^{-1}(j), \sigma^{-1}(i), \sigma^{-1}(k)}}_{\sigma^{-1}(i) \leftrightarrow \sigma^{-1}(j)} \\ &= - \sum_{\sigma} \text{sgn}(\sigma) \alpha_{\sigma^{-1}(i), \sigma^{-1}(j), \sigma^{-1}(k)} \\ &= - (\alpha_N)_{cijk} \end{aligned}$$

if  $d=2$ .  $i, j, k \in \{1, 2\}$

$$\alpha_{1,1,2} = -\alpha_{1,1,2} = 0$$

$\Rightarrow$  all elements  $\alpha_{ijk} = 0$

$V = k^d$ . the irrep corresponding to a Young diagram is  $\mathcal{D}$  of  $d$  is smaller than the number of rows of the Young diagram.

③

$$C_{B,1} = (e + (12))(e - (13)) = e + (12) - (13) - \underline{(132)}$$

$$C_{B,1} V^{\otimes 3} = \text{Span} \{ v_i \otimes v_j \otimes v_k + \underline{v_j} \otimes \underline{v_i} \otimes v_k - \underline{v_k} \otimes v_j \otimes v_i - \underline{v_k} \otimes v_i \otimes v_j \}$$

$$(\alpha_2)_{ijk} = \alpha_{ijk} + \alpha_{jik} - \alpha_{kji} - \alpha_{jki} \quad i \rightarrow k \rightarrow j$$

$$\left( \begin{array}{l} \sigma: v_i \otimes v_j \otimes v_k \rightarrow v_{\sigma(i)} \otimes v_{\sigma(j)} \otimes v_{\sigma(k)}, \\ \alpha_{ijk} \rightarrow \alpha_{\sigma^{-1}(i), \sigma^{-1}(j), \sigma^{-1}(k)} \end{array} \right) \quad i \leftarrow k \leftarrow j$$

$$\left. \begin{array}{l} (\alpha_2)_{ijk} + (\alpha_2)_{jki} + (\alpha_2)_{kij} = 0 \quad - A \\ (\alpha_2)_{ijk} = -(\alpha_2)_{kji} \end{array} \right. \quad - B$$

$$\underline{\underline{\begin{array}{|c|c|c|} \hline 1 & 2 & 3 \\ \hline \end{array}}} : B \rightarrow (\alpha_2)_{ijk} = -(\alpha_2)_{jik}$$

In physics.  $\text{Sym}^n V$  for bosons  $\lambda = (n)$

$\Lambda^n V$  for fermions  $\lambda = (1, 1 \dots 1)$

other partitions : parastatistics

2.  $G = \text{SU}(2) \subset \text{GL}(2, \mathbb{C})$  irreps

We consider Young diagrams with at most 2 rows.

The corresponding Young symmetrizer.

$$\begin{aligned}
 C_T &= P_T Q_T \\
 &= \left( \begin{array}{c} v_{i_1} \wedge v_{i_2} \\ \vdots \\ := v_{i_1} \otimes v_{i_2} \\ - v_{i_2} \otimes v_{i_1} \end{array} \right) \\
 C_T \cdot v_{i_1} \otimes v_{i_2} \otimes \cdots \otimes v_{i_n} \quad (i_m \in \{1, 2\}) & \\
 &= P_T \underbrace{(v_{i_1} \wedge v_{i_2}) \otimes (v_{i_3} \wedge v_{i_4}) \otimes \cdots \otimes (v_{i_{2k-1}} \wedge v_{i_{2k}})}_{Q_T = \prod_{i=1}^k e - (2i-1, 2i)} \otimes v_{i_{2k+1}} \otimes \cdots \otimes v_{i_{2k+2}}
 \end{aligned}$$

The non-zero images of  $C_T$  is

$$C_T \bigotimes_{j=1}^n V_{i_j} = \underbrace{P_T [\bigotimes_{j=1}^k (V_1 \wedge V_2)] \otimes V_{i_{2k+1}} \otimes \cdots \otimes V_{i_{2k+l}}}_{= (-1)^{k \cdot k}} \otimes P_{T'} (V_{i_{2k+1}} \otimes \cdots \otimes V_{i_{2k+l}})$$

$$T': \boxed{\quad | \quad | \quad | \quad |}$$

$\underbrace{\qquad\qquad\qquad}_{\ell}$

$\sqrt{\otimes^n}$  as rep of  $su(2)$ .

$u \in \text{SU}(2)$  acts on  $v_1 \wedge v_2$

$$\begin{aligned}
 u \cdot (v_1 \wedge v_2) &= u(v_1 \otimes v_2 - v_2 \otimes v_1) \\
 &= \sum_{ij} u_{i1} u_{j2} v_i \otimes v_j - \sum_{ij} u_{i2} u_{j1} v_i \otimes v_j \\
 &= (u_{11} u_{12} - u_{12} u_{11}) v_1 \otimes v_1 + \\
 &\quad (u_{11} u_{22} - u_{12} u_{21}) v_1 \otimes v_2 + \\
 &\quad (u_{21} u_{12} - u_{22} u_{11}) v_2 \otimes v_1 + \\
 &\quad (u_{21} u_{22} - u_{22} u_{21}) v_2 \otimes v_2 \\
 &= (\det u) v_1 \wedge v_2
 \end{aligned}$$

$$u^{\otimes n} \left( C_T \hat{\otimes}_j v_{i_j} \right) = (\det u)^{\frac{1}{2}} (-1)^{\sum_i} (v_1 \wedge v_2) \otimes u^{\otimes l} P_T (v_{i_{2k+1}} \otimes \dots \otimes v_{i_{2k+l}})$$

$u \in \text{SU}(2)$  acts non-trivially only on  $\underbrace{P_T(v_{i_{2k+1}} \otimes \dots \otimes v_{i_{2k+l}})}$

$\Rightarrow$  irreps of  $\text{SU}(2)$  is in one-to-one correspondence with Young diagrams of a single row of  $l$  boxes

Dimension of the irrep.

$$\begin{aligned}
 d=2 : \quad \binom{l+d-1}{d} &= \binom{l+1}{l} = l+1 & \text{span } \{ v_{i_1} \otimes \dots \otimes v_{i_{l+1}} \} \\
 & \quad i_1 \leq i_2 \leq \dots \leq i_{l+1} \\
 & \quad \dim = l+1
 \end{aligned}$$

in physics,  $l=2j$  "spin- $j$  representation of  $\text{SU}(2)$ "

$\Rightarrow$  irreps :  $\text{Sym}^l V$ .  $V \cong \mathbb{C}^2$  the fundamental rep.
