

Group Theory and Its Applications

Yi Lu

Draft of September 15, 2026

Work in progress. These notes are written up as the course runs; several chapters are still an outline only, and nothing here has been through a careful revision. Corrections are welcome.

ACKNOWLEDGEMENT. These notes draw in part on a $\LaTeX$ transcription that Kong Shuo (孔硕), then a student on this course, made from the 2025 lectures and from my handwritten notes. His careful and unprompted work is used throughout the earlier chapters and is gratefully acknowledged.

Contents

Principal texts	v
I. Groups	1
1. Introduction	3
1.1. Three themes of twentieth-century physics	3
1.2. What symmetry is, and how to measure it	3
1.3. Discrete symmetry	4
1.3.1. Mirror symmetry in a molecule	4
1.3.2. Particle exchange	5
1.3.3. Crystals	5
1.4. Continuous symmetry and Noether's theorem	6
2. Groups: basic definitions and examples	9
2.1. Definition and first examples	9
2.2. Subgroups, order, and cyclic groups	10
2.3. Equivalence relations and residue classes	11
2.4. Direct products and Abelian groups	12
2.5. Matrix groups	12
2.6. Generators and presentations	16
2.7. Application: the Pauli group and stabilizer codes	18
3. Homomorphism and isomorphism	23
3.1. Homomorphism and isomorphism	23
3.2. Kernel and image	25
3.3. Examples	26
3.4. $SU(2)$ and $SO(3)$	27
3.5. $GL(V)$ and $GL(n, \kappa)$	28
4. Group actions	31
4.1. Actions, G -sets, and orbits	31
4.2. Induced action on function spaces	31
4.3. Equivariant maps	31
4.4. Orbit-stabilizer theorem	31
4.5. Conjugacy, centralizers, and normalizers	31
4.6. The class equation	31
4.7. p -groups and Cauchy's theorem	31
5. The symmetric group	33
5.1. Permutations, cycles, and transpositions	33
5.2. Cayley's theorem	33

5.3. Parity and the alternating group	33
5.4. The braid group	33
6. Cosets, Lagrange, and conjugacy	35
6.1. Cosets and Lagrange's theorem	35
6.2. Conjugacy	35
6.3. Class functions and characters	35
6.4. Conjugacy classes of S_n and Young diagrams	35
7. Normal subgroups, quotients, and extensions	37
7.1. Normal subgroups	37
7.2. Quotient groups	37
7.3. The isomorphism theorems	37
7.4. Exact sequences	37
7.5. Central extensions and the finite Heisenberg group	37
II. Representation theory	39
8. Representations	41
8.1. Motivation: why representations	41
8.2. Basic definitions	41
8.3. Examples of representations	41
8.4. Operations on representations	41
9. Unitarity and reducibility	43
9.1. Unitary representations and the Haar measure	43
9.2. The regular representation	43
9.3. Reducible and irreducible representations	43
10. Schur's lemmas and orthogonality	51
10.1. Schur's lemmas	51
10.1.1. Schur's lemmas I and II	51
10.2. Orthogonality relations and the Peter–Weyl theorem	58
10.2.1. Motivation and importance	58
10.2.2. Preliminaries: $L^2(G)$ as a $G \times G$ representation	59
10.2.3. The Peter–Weyl theorem	60
III. Applications	73
11. Point groups and crystal field theory	75
11.1. Crystallographic point groups	75
11.2. Character tables	75
11.3. Splitting of atomic orbitals	75
11.4. Weak and strong field limits	75
11.5. Hybridization and molecular orbitals	75
12. Light–matter interaction and selection rules	77
12.1. Dipole selection rules	77

12.2. Spectroscopy of the cuprates	77
12.3. Symmetry of superconducting order parameters	77
