

Group Theory and Its Applications

Yi Lu

Draft of September 16, 2026

Work in progress. These notes are written up as the course runs; several chapters are still an outline only, and nothing here has been through a careful revision. Corrections are welcome.

ACKNOWLEDGEMENT. These notes draw in part on a $\LaTeX$ transcription that Kong Shuo (孔硕), then a student on this course, made from the 2025 lectures and from my handwritten notes. His careful and unprompted work is used throughout the earlier chapters and is gratefully acknowledged.

Contents

Principal texts	v
I. Groups	1
1. Introduction	3
1.1. Three themes of twentieth-century physics	3
1.2. What symmetry is, and how to measure it	3
1.3. Discrete symmetry	4
1.3.1. Mirror symmetry in a molecule	4
1.3.2. Particle exchange	5
1.3.3. Crystals	5
1.4. Continuous symmetry and Noether's theorem	6
2. Groups: basic definitions and examples	9
2.1. Definition and first examples	9
2.2. Subgroups, order, and cyclic groups	10
2.3. Equivalence relations and residue classes	11
2.4. Direct products and Abelian groups	12
2.5. Matrix groups	12
2.6. Generators and presentations	16
2.7. Application: the Pauli group and stabilizer codes	18
3. Homomorphism and isomorphism	23
3.1. Homomorphism and isomorphism	23
3.2. Kernel and image	25
3.3. Examples	26
3.4. $SU(2)$ and $SO(3)$	27
3.5. $GL(V)$ and $GL(n, \kappa)$	30
4. Group actions	33
4.1. Actions, G -sets, and orbits	33
4.2. Induced action on function spaces	33
4.3. Equivariant maps	33
4.4. Orbit-stabilizer theorem	33
4.5. Conjugacy, centralizers, and normalizers	33
4.6. The class equation	33
4.7. p -groups and Cauchy's theorem	33
5. The symmetric group	35
5.1. Permutations, cycles, and transpositions	35
5.2. Cayley's theorem	35

5.3. Parity and the alternating group	35
5.4. The braid group	35
6. Cosets, Lagrange, and conjugacy	37
6.1. Cosets and Lagrange's theorem	37
6.2. Conjugacy	37
6.3. Class functions and characters	37
6.4. Conjugacy classes of S_n and Young diagrams	37
7. Normal subgroups, quotients, and extensions	39
7.1. Normal subgroups	39
7.2. Quotient groups	39
7.3. The isomorphism theorems	39
7.4. Exact sequences	39
7.5. Central extensions and the finite Heisenberg group	39
II. Representation theory	41
8. Representations	43
8.1. Motivation: why representations	43
8.2. Basic definitions	43
8.3. Examples of representations	43
8.4. Operations on representations	43
9. Unitarity and reducibility	45
9.1. Unitary representations and the Haar measure	45
9.2. The regular representation	45
9.3. Reducible and irreducible representations	45
10. Schur's lemmas and orthogonality	53
10.1. Schur's lemmas	53
10.1.1. Schur's lemmas I and II	53
10.2. Orthogonality relations and the Peter–Weyl theorem	60
10.2.1. Motivation and importance	60
10.2.2. Preliminaries: $L^2(G)$ as a $G \times G$ representation	61
10.2.3. The Peter–Weyl theorem	62
III. Applications	75
11. Point groups and crystal field theory	77
11.1. Crystallographic point groups	77
11.2. Character tables	77
11.3. Splitting of atomic orbitals	77
11.4. Weak and strong field limits	77
11.5. Hybridization and molecular orbitals	77
12. Light–matter interaction and selection rules	79
12.1. Dipole selection rules	79

12.2. Spectroscopy of the cuprates	79
12.3. Symmetry of superconducting order parameters	79
