

Group Theory and Its Applications

Yi Lu

Draft of October 5, 2026

*Work in progress. These notes accompany the course and are revised as it proceeds.
Chapters are released after review. Corrections are welcome.*

ACKNOWLEDGEMENT. These notes draw in part on a $\LaTeX$ transcription that Kong Shuo (孔硕), then a student on this course, made from the 2025 lectures and from my handwritten notes. His careful and unprompted work is used throughout the earlier chapters and is gratefully acknowledged.

Contents

Principal texts	vii
-----------------	-----

I. Groups	1
-----------	---

1. Introduction	3
-----------------	---

1.1. Three themes of twentieth-century physics	3
1.2. What symmetry is, and how to measure it	3
1.3. Discrete symmetry	4
1.4. Continuous symmetry and Noether's theorem	6

2. Groups: basic definitions and examples	9
---	---

2.1. Definition and first examples	9
2.2. Subgroups, order, and cyclic groups	10
2.3. Equivalence relations and residue classes	11
2.4. Direct products and Abelian groups	12
2.5. Matrix groups	12
2.6. Generators and presentations	16
2.7. Application: the Pauli group and stabilizer codes	18

3. Homomorphism and isomorphism	23
---------------------------------	----

3.1. Homomorphism and isomorphism	23
3.2. Kernel and image	25
3.3. Examples	26
3.4. $SU(2)$ and $SO(3)$	27
3.5. $GL(V)$ and $GL(n, \kappa)$	31

4. Group actions	35
------------------	----

4.1. Actions, G -sets, and orbits	35
4.2. Cosets, Lagrange's theorem, and orbit-stabilizer	38
4.3. Equivariant maps	42
4.4. Conjugacy, centralizers, and normalizers	43
4.5. The class equation	46
4.6. Finite rotation groups	47
4.7. Induced action on function spaces	49

5. The symmetric group	51
------------------------	----

5.1. Permutations, cycles, and cycle decomposition	51
5.2. Cayley's theorem	53
5.3. Transpositions, parity, and the alternating group	54
5.4. Conjugacy classes of S_n and Young diagrams	58
5.5. Permutations in physical systems	60

6. Normal subgroups, quotients, and extensions	65
6.1. Normal subgroups	65
6.2. Quotient groups	67
6.3. The isomorphism theorems	69
6.4. Exact sequences and group extensions	71
6.4.1. Split extensions and semidirect products	72
6.4.2. Central extensions	75
6.5. The finite Heisenberg group	76
6.5.1. Clock and shift matrices	77
6.5.2. Projective representations and central extensions	79
 II. Representation theory	 83
7. Representations	85
7.1. Symmetry operators and physical systems	85
7.1.1. Quantum states and Wigner's theorem	86
7.2. Representations and equivalence	88
7.3. Examples and translation symmetry	90
7.3.1. A periodic hopping chain	92
7.4. Constructions of representations	94
7.4.1. Dual and conjugate representations	95
7.4.2. Symmetric and exterior squares	97
7.5. Characters	97
 8. Unitarity and reducibility	 101
8.1. Unitary representations and Haar measure	101
8.1.1. Invariant integration	102
8.2. The regular representation	104
8.2.1. Matrix coefficients	105
8.3. Reducible and irreducible representations	106
8.3.1. Complete reducibility	107
8.3.2. Representations without invariant complements	109
8.4. Isotypic components and multiplicities	109
 9. Schur's lemmas, orthogonality, and characters	 111
9.1. Schur's lemmas	111
9.1.1. Multiplicity spaces and invariant operators	112
9.2. Orthogonality and the Peter–Weyl theorem	114
9.2.1. Finite-dimensionality of compact-group irreducibles . .	114
9.2.2. Orthogonality of matrix coefficients	115
9.2.3. Completeness of matrix coefficients	116
9.3. Characters and character tables	117
9.3.1. Finite-group character tables	119
9.4. Projection operators and symmetry-adapted bases	121
9.5. Tensor products and restriction	123
9.5.1. Restriction and branching	124
9.6. Operator selection rules	125

9.7. Supplementary group algebra and class operators	126
9.7.1. Chen's eigenfunction method	128
10. Rotations and tensor symmetries	133
10.1. Irreducible representations of $SU(2)$ and $SO(3)$	133
10.1.1. Angular-momentum generators	133
10.1.2. Homogeneous polynomials and rotation matrices	135
10.2. Spherical harmonics and Cartesian tensors	136
10.3. Clebsch–Gordan decomposition	138
10.4. Tensor operators and the Wigner–Eckart theorem	140
10.5. Young symmetrizers and symmetric-group irreducibles	142
10.6. Schur–Weyl decomposition and tensor powers	144
10.7. Induced representations	146
III. Applications	151
11. Point groups and local excitations	153
11.1. Point groups, character tables, and basis functions	153
11.2. Vibrational modes and crystal-field splitting	155
11.2.1. Displacements and the water molecule	155
11.2.2. Restricting the atomic d shell	157
11.3. Spin, time reversal, and Kramers degeneracy	158
11.4. Many-electron states and multiplets	160
11.4.1. The state space for N electrons	160
11.4.2. Combining orbital and spin permutation symmetry	161
11.4.3. Three electrons in a p shell	162
11.4.4. Ni^{2+} and electron-number parity	164
11.5. Hybridization and spectroscopic applications	165
12. Translation symmetry and Bloch states	169
12.1. Lattices and translation characters	169
12.2. Bloch's theorem and reciprocal space	171
12.3. Elementary electron and phonon bands	175
12.3.1. Hopping and electron bands	175
12.3.2. Displacements and phonon bands	176
12.4. Time reversal and momentum-space degeneracy	178
12.5. Moiré lattices and Brillouin zones	180
13. Crystal and magnetic symmetries of bands	185
13.1. Space groups and their action on Bloch states	185
13.2. Little groups, compatibility relations, and band degeneracies	187
13.3. Nonsymmorphic symmetry and projective representations	189
13.4. Band representations and symmetry-constrained Hamiltonians	191
13.5. Magnetic symmetries and spin groups	194
13.6. Altermagnetism and spin splitting	196
14. Order parameters, density waves, and superconductivity	201
14.1. Order parameters and symmetry breaking	201

Contents

14.2. Invariant free energies and residual symmetries	202
14.3. Density waves and momentum stars	203
14.4. Superconducting pair amplitudes and gap representations . . .	205
14.5. Gap nodes and quasiparticle spectra	207
14.6. Pair-density waves	208
14.7. Coupled and intertwined orders	209
15. Symmetry-protected phases	215
15.1. Gapped phases and symmetry protection	215
15.2. The Haldane chain and projective boundary representations . .	216
15.2.1. The projective action at one end	217
15.2.2. Entanglement and string order	218
15.3. The SSH chain and boundary states	219
15.4. Time-reversal-invariant topological insulators	221
15.4.1. Helical boundary states	222
15.4.2. Inversion parities and the bulk index	223
15.5. The Kitaev superconducting chain	224
